ABSTRACT

dust

Keywords: keyword1 – keyword2 – keyword3

1. INTRODUCTION

2. SIMULATIONS

2.1. *Illustris TNG*

describe what galaxy properties (SFH, ZH, etc) are available TODO

2.2. *SIMBA*

describe what galaxy properties (SFH, ZH, etc) are available TODO

2.3. *Spectral Energy Distributions*

describe how the SED is generated using the SFH and ZHs TODO

2.4. *Forward Modeling SDSS Photometry and Spectra*

3. EMPIRICAL DUST MODELING

$$F_o(\lambda) = F_i(\lambda) 10^{-0.4 A(\lambda)} \tag{1}$$

where F_o is the observed flux, F_i is the intrinsic flux, and $A(\lambda)$ is the attenuation curve.

$$A(\lambda) = A_V \frac{k(\lambda)}{k_V} \tag{2}$$

Throughout we use the slab model (Somerville & Primack 1999)

$$A_V = -2.5 \log \left[\frac{1 - e^{-\tau_V \sec i}}{\tau_V \sec i} \right] \tag{3}$$

i is the inclication, which we uniformly sample

table of free parameters

3.1. *Naive Model*

We use Calzetti (2001)

$$k_{\mathrm{Cal}}(\lambda) = \begin{cases} 2.659(-1.857 + 1.040/\lambda) + R_V, & 6300\mathring{A} \leq \lambda \leq 22000\mathring{A} \\ 2.659(-2.156 + 1.509/\lambda - 0.198/\lambda^2 + 0.011/\lambda^3) + R_V & 1200\mathring{A} \leq \lambda \leq 6300\mathring{A} \end{cases}$$

and

$$\tau_V = m_\tau \log\left(\frac{M_*}{10^{10}M_\odot}\right) + c_\tau \tag{4}$$

3.2. *Less Naive Model*

We use the attenuation curve from Noll et al. (2009)

$$k(\lambda) = (k_{\mathrm{Cal}}(\lambda) + D(\lambda))\left(\frac{\lambda}{\lambda_V}\right)^\delta \tag{5}$$

λ_V is the V band wavelength. $D(\lambda)$ is the bump.

$$D(\lambda) = \frac{E_b(\lambda\Delta\lambda)^2}{(\lambda^2 - \lambda_0^2)^2 + (\lambda\Delta\lambda)^2} \tag{6}$$

we assume fixed $\lambda_0 = 2175\mathring{A}$ and $\Delta\lambda = 350\mathring{A}$. E_b is the strength of the bump. δ, the slope of the attenuation curve, also correlates with galaxy properties. Kriek & Conroy (2013), and **?** more recently with simulations, demonstrated E_b correlates with the slope of the attenuation curve. So we parameterize δ and E_b:

$$\delta(M_*) = m_\delta \log\left(\frac{M_*}{10^{10}M_\odot}\right) + c_\delta \tag{7}$$

$$E_b = m_E\ \delta + c_E \tag{8}$$

3.3. *Less Less Naive Model*

We use the attenuation curve from Noll et al. (2009)

$$\tau_V = m_{\tau,1} \log\left(\frac{M_*}{10^{10}M_\odot}\right) + m_{\tau,2} \log \mathrm{SFR} + c_\tau \tag{9}$$

$$\delta(M_*, \mathrm{SFR}) = m_{\delta,2} \log\left(\frac{M_*}{10^{10}M_\odot}\right) + m_{\delta,2} \log \mathrm{SFR} + c_\delta \tag{10}$$

$$E_b = m_E\ \delta + c_E \tag{11}$$

3.4. *Likelihood-Free Inference*

Approximate Bayesian Computation with Population Monte Carlo Hahn et al. (2017), discussion of observables and distance metric Ishida et al. (2015)

4. RESULTS

5. SUMMARY

ACKNOWLEDGEMENTS

It's a pleasure to thank ... This material is based upon work supported by the U.S. Department of Energy, Office of Science, Office of High Energy Physics, under contract No. DE-AC02-05CH11231. This project used resources of the National Energy Research Scientific Computing Center, a DOE Office of Science User Facility supported by the Office of Science of the U.S. Department of Energy under Contract No. DE-AC02-05CH11231.
